

Tray Seating

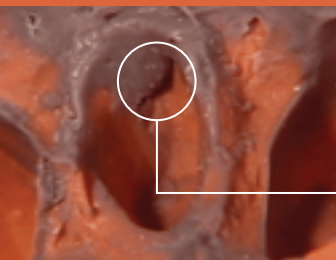

Photo #1
Ledges

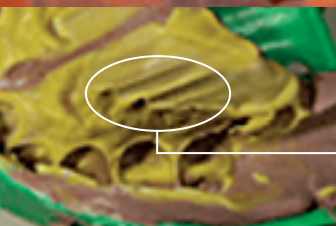

Photo #2
Drags

Issue

- Ledges. (photo #1)

- Drags. (photo #2)

- Delamination (poor blending and adhesion of wash to tray material).

Cause

- Rapid tray seating.
- Placing and seating the tray in the mouth in one motion.
- Failure of the impression material to adapt to the teeth.
- Teeth rebounding off the tray and sliding into position.

Solution

- Position the tray before seating. Use a slow, steady, vertical seating motion to allow for blending of tray/wash materials.
- Carefully position the tray before seating. Once positioned, seat the tray vertically.
- Seat the tray slowly.
- Avoid contact of teeth with tray.

Tray Seating *(continued)*

Issue

■ Slanted or wavy teeth.

■ Rocking crown.

■ Short crowns.

Cause

■ ■ Tray movement after seating.

■ Teeth in contact with tray and/or not adequately relieving pre-set impression material.

Solution

■ ■ After tray seating, use passive pressure to immobilize the tray for the full recommended oral set time.

■ Avoid contact of teeth with tray or pre-set tray material.
